# ACDI ENERGY SERVICES SOFTWARE

The AES software is the lifeblood of our devices. It goes beyond simply managing the flow of electricity to your charging stations. This comprehensive platform gives our station owners complete visibility into and control of their devices. It also facilitates the seamless interaction between charger and EV driver. Some highlights of the software include:

- **Remote Management:** Monitor, control, and analyze your charging activity from anywhere.
- **Billing and Payment Control:** Manage secure payment options, create tiered pricing rates based on specific user groups, and track cost vs revenue.
- **Energy Management and Optimization:** Create dynamic pricing with fluctuating energy costs, and balance energy loads over multiple chargers simultaneously.
- **User Access Management:** Open charging access to the general public or limit access to specific user groups (or both).
- **Data and Reporting:** Gain insights into charging behavior, energy consumption, and network/charger performance. Create alerts and regularly scheduled reports.
- **Mobile App Integration:** End users find, authenticate, and pay for charging through our integrated driver mobile app.
- **Scalability:** Regardless of number of units or geographic location, all can be managed from our single dashboard as your charger network grows.
